# 1.Pana

Pana is a library for analyzing dart packages. The name pana is derived from ‘PAckage aNAlyzer.’ It is called a package analyzer because it provides a report summarizing the health and quality of dart packages.

# 5. Flutter Commands

The Flutter command is a way to manage your state based on ValueListenable and the command design pattern. ValueNotifier can hold just one value. It doesn't recreate the whole widget tree on calling setState(). Flutter offers the same that BLoC does but in a more logical way.

```
usage: flutter [Flutter command] [arguments]
```

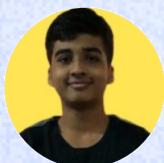

Common commands:

- `flutter create <new_directory>`  
Create a new Flutter project in the specified directory.
- `flutter run [options]`  
Run your Flutter application on an attached device or in an emulator.

Learn: [Flutter commands \(long-form\)](#)

Global options:

- `--help` Print this usage information.
- `--verbose` Enable logging, including all shell commands executed.  
Or used with `--help`, shows hidden options. Or used with `--diagnostic-information`. (Use `--vv` to force verbose logging.)
- `--device-id` Target device id or name (prefixed with `adb`).
- `--version` Reports the version of this tool.
- `--suppress-analytics` Suppress analytics reporting when this command runs.

# 6.Flow Builder

A Flutter package that is useful in simplifying navigation flows. The flow state will be the state which drives the flow. A new navigation stack is generated whenever there is a new flow state. It is flexible and easy.

# 7. Recase

Recase changes the case of the input text to the desired case convention. It is a small yet useful package. This package requires at least Dart 2.6.

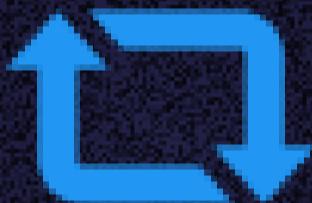

Best **Flutter**  
Packages
